KEY TAKEAWAYS:

1. Although laudable in its intent to dispel consumer confusion and encourage alignment in a common sustainability language, there is concern that the EU will use an incomplete methodology to calculate the impact of clothing and footwear, which will result in oversimplified and inaccurate claims on product labels for consumers.

2. A collaboration of experts and organisations are working to promote awareness of this issue amongst European policy makers, asking them to amend the PEF methodology before implementation.

3. We are asking for your support to advocate for methodology improvements to ensure consumers receive meaningful and balanced information about a product's footprint, which is not biased in favour of any raw material fibre type.

WHAT IS THE EU PROPOSAL FOR CLOTHING SUSTAINABILITY CLAIMS?

Currently, sustainability language is disparate and inconsistent, largely due to a lack of common language and relatively lax or varying labelling requirements. This leads to high levels of greenwashing, related consumer confusion and has delayed the fashion and textiles industry from truly addressing sustainability.

As part of its work around circular economy and consumer protection, the EU is proposing that companies substantiate the environmental claims they make on clothing using a harmonised methodology. While its aims are laudable, the current methodology being proposed – the Product Environmental Footprint (PEF) – is narrowly drawn and fails to adequately take account of key sustainability considerations including the benefits of using renewable and biodegradable fibres, the adverse impacts of microplastic pollution and the full environmental footprint of fossil fuel fibres. As such, the PEF risks misleading consumers about the impacts of their products, and ultimately undermining the EU’s sustainability objectives.
WHAT IS PEF?

PEF was first proposed by the European Commission (EC) in April 2013, under the Building a Single Market for Green Products Initiative. The focus at that time was on developing product footprinting methodologies to provide a harmonised system for measuring and validating environmental claims and a level playing field for competition between products made in different Member States.

Subsequently, the EC partnered with industry experts and private companies to develop a methodology designed to convey a finished good’s environmental impact in a common, product-level language that enables consumers to make informed decisions at the point of purchase. The PEF uses lifecycle assessment (LCA) data to evaluate the environmental impact of materials. See more about LCAs in the additional information on page 10 below.

The PEF methodology is now being considered for application on clothing and footwear products and policy. The expectation is that consumers faced with claims using PEF on labels at the point of sale will make purchasing decisions in favour of the planet.

WHAT DOES PEF AIM TO MEASURE?

The PEF focusses on measuring and communicating harmful environmental impacts, with 16 environmental impact categories currently identified in the methodology.3

HOW COULD THE PEF METHODOLOGY BE IMPROVED?

There are critical environmental impacts that either aren't fully accounted for, or aren't included in the PEF methodology, that could significantly distort the credibility of the EU’s environmental impact ratings of clothing and footwear products.

For consumers to understand the sustainability credentials of a product, they also need information on social impacts.

**HOW COULD THE PEF METHODOLOGY BE IMPROVED?**

It is in the consumers’ interest that any method used to assess a product’s environmental footprint is holistic and includes all sustainability impacts of consequence. Being LCA-based, PEF suffers from limitations by focusing only on harmful impacts and failing to account for positive environmental impacts. Social impacts should also be considered for a holistic assessment of a product’s sustainability.

### 1. Microplastic pollution

Synthetic textiles discharge significant amounts of microplastic fibres through laundering and wear, releasing microplastics into both terrestrial and marine environments, and the human food chain. However, microplastic pollution from synthetic materials is not included in the current environmental impacts of the PEF methodology and therefore does not carry any negative scoring despite increasing scientific evidence of the harmful impact to both planetary and human health. Scientific studies have shown that a typical 5 kg wash load of polyester fabrics can release as many as 6 million microplastic fibres. It is estimated that, by 2030, synthetic fibres will represent 73% of fibre production, of which 85% will be polyester.

### 2. Environmental impact of fossils

The full environmental impacts of the formation of crude oil – a base material for producing synthetic fibres - are not accounted for in the PEF methodology. PEF accounting for synthetic fibres commences at extraction at the wellhead, rather than the raw material formation. By contrast, all the impacts of forming natural fibres are fully taken into account, including the greenhouse gas emissions, land and water use, etc.

Given that textile fibres often show the greatest lifecycle impacts during the fibre formation stage, this limitation of PEF magnifies the inequity between products made from natural and fossil fuel-based fibres. It’s impractical to capture and account for the ancient environmental impacts of forming crude oil, so methodology improvement is needed to enable equitable comparison of fibre types.

3. Renewability & biodegradability

The circular attributes of natural fibres, such as renewability at the start-of-life, high levels of reuse and recycling during life and biodegradability at end-of-life are not counted or only minimally counted in the current PEF methodology. Natural fibres are renewable resources that can be regenerated by living systems, as opposed to the extraction of finite fossils to produce synthetic fibres. Raw materials grown on farms are inherently circular. They can be grown and regrown indefinitely and biodegrade at end-of-life, returning their nutrients to the soil to be used again. PEF does not offer any positive scoring for biodegradable fibres, while non-biodegradable fibres are not penalised for continually adding solid waste to the world’s landfills and further releasing microplastics to the soil, oceans and air.

This limitation could be addressed by including parameters that account for biological circularity in the overall score. Combining material circularity indicators i.e. Ellen MacArthur Foundation and Granta Design with lifecycle indicators such as PEF could provide a solution.

4. Duration of service life

The European Environmental Agency (EEA) recognises that natural fibres have better durability and lower impacts in the use phase and end-of-life, compared to synthetic fibres. Inherent attributes of animal fibre-based clothing, including its odour resistance and wrinkle resistance result in less frequent laundering, reducing water, energy and detergent use. Less frequent laundering retains the ‘as new’ appearance of clothing, enabling a longer serviceable lifetime. Other important life-extending factors omitted from duration of service assessment include adjustable clothing fit and enduring fashion design.

5. Production practices

Under PEF, the impacts of production practices are modelled without considering how they are derived, meaning the use of renewable resources and sustainable management practices aren’t accounted for, or incentivised. For example, the PEF method doesn’t differentiate for farming practices that may reduce environmental impacts of producing natural fibres, such as regenerative agriculture or organic farming, and will in fact reward unsustainable practices by applying a generic calculation method.
6. Social impacts

If the aim of harmonising sustainability claims is to encourage consumers to purchase more sustainable garments, causing brands to source more sustainable fibres, exactly who is going to be impacted must be carefully considered. The globally agreed definition of sustainability is consumption that meets the needs of the present without compromising the ability of future generations to meet their needs, and within needs, those of the world’s poor must be given priority.

This means that traditional, localised and rural industries that support the thriving of communities must be considered. These industries include the production of wool, alpaca, cashmere, silk and cotton, which financially and socially support rural farmers, communities and regional supply chains across the globe.

Accounting for the social impacts of manufacturing textiles, with important considerations such as meaningful wages and working conditions, is also necessary to transition to a truly sustainable fashion and textile industry.

Growing natural fibres provides an income for rural, remote, and poor communities which is inseparable from their sustainability. Cotton is 50% of Benin's export income.7 Alpaca sales are crucial to 46 of Peru's poorest provinces, where 35.3% of the population had insufficient income to meet their basic needs in 2018.8 Consumers shouldn’t be told to purchase or not purchase garments made of farmed fibres based solely on environmental impact. Socio-economic impacts must be considered as part of sustainability claims made on clothing and footwear labels.

DOES PEF ALIGN WITH THE EU’S OWN SUSTAINABILITY AND CIRCULAR ECONOMY GOALS?

By omitting or downplaying the inherently circular attributes of natural fibres (including renewability and biodegradability), duration of service life, production practices and social impacts, the EC risks losing an important opportunity to deliver its commendable goals detailed in the Circular Economy Action Plan (CEAP), sustainable product policy framework and EU Strategy for Textiles. Similarly, without accounting for microplastics, the opportunity to deliver the Plastics Strategy is reduced. Both the Green Deal and CEAP have prioritised addressing harmful sources of pollution such as microplastics.

Circular Economy Action Plan (CEAP)

The CEAP, adopted by the European Commission in March 2020, is one of the main building blocks of the European Green Deal. The CEAP’s aims are to ensure products placed on the EU market are “designed to last longer, are easier to reuse, repair and recycle”; that “consumers will have access to reliable information on issues such as reparability and durability of product”; and has a focus on “avoiding waste altogether.” Textiles have been identified as one of the sectors that use most resources and where the potential for circularity is high. The CEAP commits that “the Commission will also propose that companies substantiate their environmental claims using Product and Organisation Environmental Footprint methods.”

The CEAP presents a set of interrelated initiatives to make sustainable products, services, and business models the norm and transform consumption patterns:

Sustainable Product Policy Framework

Through the sustainable product policy framework, the Commission’s stated aim is to bring all products produced or sold in the EU in line with technical standards for sustainability within a legal framework. It will focus on “improving product durability, reusability, upgradability and reparability”, “enabling high-quality recycling”, reducing and “rewarding products based on their different sustainability performance”. The Commission plans to “analyse additional legislative and non-legislative actions including, but not limited to:... EU rules for requirements on mandatory sustainability labelling and disclosure of information to consumers on products along value chains.”

EU Strategy for Textiles

The EU Strategy for Textiles will include a comprehensive set of measures to “help the EU shift to a climate-neutral, circular economy where products are designed to be more durable, reusable, repairable, recyclable and energy-efficient”, provide incentives for “circular materials and production processes” and boost the sorting, re-use and recycling of textiles. Furthermore, the strategy will address the “environmental and social impacts” of the EU textile sector.

EU Plastics Strategy

Through the EU Plastics Strategy, the Commission will develop “labelling, standardisation, certification and regulatory measures on unintentional release of microplastics”.

The use of the PEF methodology in its current form will not adequately reflect the EU’s own sustainability and circularity considerations. However, with some revisions it can be made fit for purpose for clothing and footwear products.

7
WHY IS IT SO IMPORTANT TO GET THIS RIGHT?

The European Commission’s policy and legislative initiative to substantiate sustainability claims is likely to set a global standard and could deliver great environmental outcomes if the PEF methodology is amended. It’s important to act now and get it right to help establish the system’s credibility and ensure well-intentioned consumers are not misled.

We owe it to the planet to produce sustainable clothing, and we owe it to consumers to make sure they know how sustainable that clothing is – and the claims on their product labels need to reflect that.
HOW CAN YOU BE INVOLVED?

We invite you to join us in raising awareness and providing solutions to support the EC to achieve its objective for apparel and footwear.

The EC is currently in its consultative stage on relevant fashion textile industry policies, so we have the collective opportunity to submit responses to the EC’s consultation over the course of 2021 and 2022. There is also opportunity to raise awareness with Members of the European Parliament who will be voting on the EC’s legislative proposal for sustainable products.

TIMELINE FOR IMPLEMENTATION

2022

The EC is currently preparing the policy and legislative proposal on requirements for sustainability claims on clothing and footwear products, with anticipated release in early 2022.

2023

PEF Category Rules for Apparel and Footwear are anticipated to be finalised.
Lifecyle Assessment (LCA)

What is an LCA?

A Lifecycle Assessment (LCA) is a detailed study or examination of the total environmental impact of a product, activity or service’s raw material acquisition and manufacturing phases. It can also examine the active use and end-of-use phases. Generally, LCA results are often used to inform decisions and enable comparisons between materials, products, and services. However, comparisons are only valid where analyses are made ‘on like terms’ and consider the same life stages to ensure equivalence between the products being compared.

Purpose

Generally, LCA results are used to inform decisions and enable comparisons between materials, products, and services.

Cradle to Gate

- Measures environmental footprint of material extraction and production phases
- Does not consider impact beyond manufacturing
- Active use and end-of-use/disposal phases are not considered

Cradle to Cradle

- A specific type of cradle to cradle assessment that reconnects the end of use phase with material extraction and production through recovering and recycling post-consumer materials

Cradle to Grave

- Measures environmental footprint from production to end of use
- Measures environmental footprint of complete lifecycle and considers all inputs and outputs of all phases
